Education

August 2020 – present: Games Design at the IT University (ITU)
Right now, I am studying the last terms of my Master's in games design at ITU and will finish in the Summer of 2022. Although I primarily learn about game design and programming, I can use this in the 'ordinary' software world for, among other things, the user experience and the availability of software or websites.

August 2018 - June 2020: Software Developer at the Copenhagen Business Academy (KEA)
My Bachelor as a Software Developer expanded on my Computer Science and honed me in some of the competencies I had gained from there. Most importantly, I learned a lot about interconnecting different IT solutions and how to create and maintain large and complex solutions.

February 2016 - June 2018: Computer scientist at the Copenhagen Business Academy (KEA)
My education as a Computer Scientist has given me a wide range of competencies so that I can code as well as possible, design structure, solve challenges and identify tasks and user cases.

The grades for my education will appear at the bottom of my resume.

August 2010 - June 2014: Rungsted Gymnasium
Here I studied the field of Global Society, which is a global and internationally oriented education, and almost all lessons were held in English.

Working experience

July 2018 - 2020: The Developer at Immeo, Part time
In the summer between my Computer Science and until I had completed my Bachelor, I was a part-time employee at Immeo. During this period, I learned how to act and work together in an IT company and how to use the various administrative tools such as Jira. I had several different projects at once which were Falck, Politiken Plus and L'Oreal Paris.

February 2020 - August 2020: It Consultant at Immeo, Full time
When I became a permanent employee at Immeo after my bachelor's, my role was to work full time with existing customers having between 4-5 projects at once. I quickly learned to familiarize myself with the very different solutions and code bases and how to manage my time and tasks in order to keep the deadlines. I left Immeo to start my Master 1st. year.

Projects:

Big international FMCG client
Here, I maintained and added new features partly to their PIM solution (InRiver) and to their API in order for partners to access their product information. The API was an ASP.net Core Backend with a React Frontend, the data was stored on a CosmosDB on Azure.

Additional big Danish clients
1) Here, I maintained an internal project and financial management system. This system was used, among other things, to assess whether a project would have a positive return and what expenses have been incurred. The system consisted of ASP.net and AngularJS, in addition, the data came from Microsoft Navision which was stored on a SQL server. On this project I had to redesign and update their project views and correct errors in the system

2) I had to add automation functionality to their PIM (InRiver) solution. Among other things, I made a system for uploading images and files that had documentation on eco-labels (the Nordic Ecolabel, etc.) and associated them with the right products.

3) I had to maintain their website and CSM (Epi Server) for their webshop. The solution was built on ASP.net and AngularJS with a SQL database. On this project I had to update their CSM solution so that it had more functionalities and in addition improve the website's SEO.

4) I had been put in charge of maintaining a self-service system for questions and / or reviews about insurance. Among other things, I had to update many of the forms because during the same period, Corona restrictions and flight cancellations abounded. The solution consisted of ASP.net, HTML and an SQL Database.
